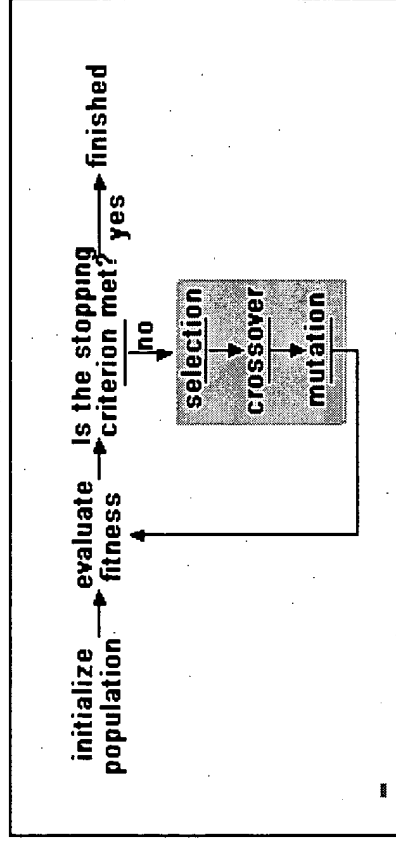

Figure 35

Evolutionary Search Augmented with Domain Knowledge

Multi-objective portfolio optimization problem is formulated as a problem with Multiple linear, nonlinear and nonlinear nonconvex objectives. However, the domain knowledge allows us to use strictly linear and convex constraints.

Knowledge about geometry of feasible space (i.e. convexity), allowed us develop a feasible space boundary sampling algorithm (solutions archive generation). By knowing the boundary of the search space, we can exploit that knowledge to design efficient interior sampling methods.

Convex crossover is a powerful interior sampling method, which is guaranteed to produce feasible offspring solutions. Given parents P_1 , P_2 , it creates offspring $O_1 = \lambda P_1 + (1 - \lambda)P_2$, $O_2 = (1 - \lambda)P_1 + \lambda P_2$. An offspring O_k and P_k can crossed over to produce more diverse offspring.

Linear Convex Feasible Space

Figure
36

Example of Outer Product using as operator the function $T(x,y)$

T-norm	Correlation Type
$T_1(x,y) = \max(0, x + y - 1)$	Extreme case of negative correlation
$T_2 = x * y$	No correlation
$T_3 = \min(x, y)$	Extreme case of positive correlation

Figure
37

Example of Outer Product using as operator the function $S(x,y)$

T-conorm	Correlation Type
$S_1 = \min(1, x + y)$	Extreme case of negative correlation
$S_2 = x + y - (x * y)$	No correlation
$S_3 = \max(x, y)$	Extreme case of positive correlation
